127 Treatments in Chronic Cholestasis in Children
   Alvarez, F. (Montreal, Qué.)

137 Nutritional Management of Cholestatic Syndromes in Childhood
   Socha, P. (Warsaw)
The Nestlé Nutrition Institute was created to provide health professionals with up to date information on nutrition and nutrition-related disorders in order to enable them to continuously improve patient care based on the latest medical and scientific breakthroughs.

One of the key pillars of the Nestlé Nutrition Institute is the Annales Nestlé, a pediatric journal that has been published on a regular basis since 1942. It contains review articles on clinical practice and research in all fields of pediatrics with focus on nutrition. Each publication deals with one specific topic, such as diabetes mellitus, HIV and nutrition or infant growth. The Annales Nestlé comprises 3 issues each year in 4 languages (English, French, Spanish and German), and with around 70,000 copies per issue is one of the most widely read pediatric journals in the world.

The Annales Nestlé is edited by an independent editorial board of six highly respected professors of pediatrics, thus guaranteeing the medical and scientific impartiality of the journal, and hence the high level of respect and appreciation in medical and scientific circles. The editorial board sets editorial policy, identifies topics to be addressed, selects authors and assesses the articles’ contents.

The Annales Nestlé are published by S. Karger AG, one of the world’s most highly respected scientific and medical publishers.
