Etienne Nel, Cape Town
Frank Ruemmele, Paris
Noel Solomons, Guatemala City
Hania Szajewska, Warsaw
Reprint of *Annals of Nutrition and Metabolism* Vol. 58, Suppl. 1, 2011

**Sponsor Note**
This publication was supported by an unrestricted educational grant by the Nestlé Nutrition Institute. The institute is a not-for-profit association which was created to provide medical and scientific information to health professionals in the field of pediatric, adult and sports nutrition with latest information on nutrition and nutrition-related disorders (available at [www.nestlenutrition-institute.org](http://www.nestlenutrition-institute.org)). Any liability of the sponsors for the content of the papers is hereby expressly excluded.

**Disclosure Statement Guest Editor**
Ferdinand Haschke is Chairman of the Nestlé Nutrition Institute, a separate non-profit-making legal entity at Nestlé, which is active in the field of medical/scientific communication. He is employed by the Nestlé Group. He is also President of the Association of the Food Industries for Particular Nutritional Uses of the European Union (IDACE), for which he does not receive consulting fees or honoraria.
Contents

5 Editorial

7 Focus on: Meeting the Nutritional Needs of the Low-Birth-Weight Infant
8 Meeting the Nutritional Needs of the Low-Birth-Weight Infant
  Ziegler, E.E. (Iowa City, Iowa)

19 Focus on: Feeding Very-Low-Birth-Weight Infants: Our Aspirations versus the Reality in Practice
20 Feeding Very-Low-Birth-Weight Infants: Our Aspirations versus the Reality in Practice
  Corpeleijn, W.E. (Amsterdam); Vermeulen, M.J.; van den Akker, C.H. (Rotterdam); van Goudoever, J.B. (Rotterdam/Amsterdam)

31 Focus on: Nutrition of Preterm Infants after Discharge
32 Nutrition of Preterm Infants after Discharge
  Cooke, R. (St. Louis, Mo.)

37 Focus on: Is Early Nutrition Related to Short-Term Health and Long-Term Outcome?
38 Is Early Nutrition Related to Short-Term Health and Long-Term Outcome?
  Szajewska, H. (Warsaw); Makrides, M. (Adelaide, S.A.)

The above articles were originally published as a supplement issue of Annals of Nutrition and Metabolism and are reprinted here with permission.
Policy Statement

The Nestlé Nutrition Institute was created to provide health professionals with up-to-date information on nutrition and nutrition-related disorders in order to enable them to continuously improve patient care based on the latest medical and scientific developments.

One of the key pillars of the Nestlé Nutrition Institute is Annales Nestlé, a pediatric journal that has been published on a regular basis since 1942. It contains review articles on clinical practice and research in all fields of pediatrics with focus on nutrition.

Annales Nestlé comprises 3 issues each year in 3 languages (English, French and Spanish), and with around 50,000 copies per issue, it is one of the most widely read pediatric journals in the world.

Annales Nestlé is edited by an independent editorial board of opinion leaders in pediatric research, thus guaranteeing the medical and scientific impartiality of the journal, and hence the high level of respect and appreciation in medical and scientific circles. The editorial board sets the editorial policy, identifies topics to be addressed, selects authors and is in charge of the review process of each publication.

As of 2011, Annales Nestlé is introducing its new concept. All articles will first be published as a supplementary issue of Annals of Nutrition and Metabolism (impact factor 2.0) and will subsequently be available as a reprint version to the reader of Annales Nestlé. Therefore, the articles will be presented to a larger audience and can be accessed online in PubMed.

We are pleased to offer you our innovative design, which results from a creative and effective cooperation with Karger Publishers, Switzerland.

Prof. Ferdinand Haschke, MD, PhD

Vevey (Switzerland)
Knowing the nutritional needs of the fetus is key to provide guidelines how to feed infants who are born with very low or low birth weight (LBW) [1]. Immediately after birth, the supply of all necessary nutrients which are essential for growth and development is interrupted. As a result, adequate nutrient supply through parenteral and enteral nutrition from the first day of life onwards is fundamental to avoid short- and long-term negative effects on health outcome. Postnatal growth restriction due to inadequate nutrient supply is associated with impaired neurological and cognitive development. Recently, a causal relationship between low protein and energy intake during the first week of life and impaired cognitive development at 2 years of age has been demonstrated. Therefore, it is important to have detailed knowledge on the requirements of energy and key nutrients such as protein, Ca, P, Mg, Na, K, and Cl. The requirements, which were calculated by Ziegler [2] by employing both factorial and empirical approaches, are the basis for adequate human milk fortifiers or formulas specially designed for that target group.

The cause of growth restriction in LBW infants after birth is multifactorial, but approximately 50% of the variance in early postnatal growth can be attributed to nutrition. It is thus necessary to know all important aspects to optimize nutritional intake during the first weeks of life. Among those are a proper infrastructure, early initiation of parenteral nutrition, transition to fortified breast milk, or preterm infant formula, and monitoring nutritional tolerance [3]. After discharge from the hospital, LBW infants still have specific nutritional needs; recommendations to continue feeding of fortified human milk or a nutrient-enriched formula need to be considered. Close monitoring of growth is most important, because both low growth and rapid ‘catch-up’ growth are associated with later adverse health outcomes [4]. LBW infants receiving supplementation of infant formula with long-chain polyunsaturated fatty acids, particularly docosahexaenoic acid, have consistently shown better visual and neurological development. The question of how much docosahexaenoic acid is needed is still controversial [5]. The most recent publications and meta-analyses on the prevention of necrotizing enterocolitis by giving certain probiotic strains to non-breast-fed LBW infants are the first to indicate that ‘good bacteria’ can help to reduce morbidity and mortality.

What are the future research needs? One major focus should be on the prevention of LBW. Out of the 134 million newborns worldwide in 2008, 15.5% had birth weights less than 2,500 g, and the mean percentages in most industrialized and developing countries are 7 and 16%, respectively. However, in a cluster of 5 countries – India, Bangladesh, Nepal, Philippines, and Ethiopia – 26% (mean) of newborns have LBW. The causes were poorly researched in the past; only recently have we started to understand the negative influence of poor quantitative and qualitative maternal nutrition on the birth weight of infants. Maternal folic acid and vitamin B12 deficiency states can play a role. Inadequate nutrition during the different stages of pregnancy can induce epigenetic phenomena, which negatively affect long-term outcome. In emerging countries, evidence-based research to define the nutritional needs during pregnancy and implementation of public health policies are urgently needed. This will help to save millions of infants from the negative short- and long-term consequences of being LBW.
