Subject Index

Adipogenesis
  fatty acids
    adipogenic hormone activity 236–238
    fat composition during development 238, 239
  mechanisms 236–238, 243
  white adipose tissue 236

Allergy
  biomarker identification 250
  breastfeeding, prevention
    allergen content of breast milk 96
    components of breast milk 94, 95
    duration of breastfeeding 100, 101
    infection role and breast milk modulation 95
  maternal asthma effects 101, 102, 106, 107
  maternal food allergen avoidance diets 103, 107
    meta-analysis 96–99, 109
    overview 93
  prospective intervention studies
    no-effect studies 102, 103, 105, 106
    positive-effect studies 99, 100
  study design 96
  cesarean section risks 91
  gut flora composition studies 85, 86, 90
  hydrolyzed infant formula prevention studies
    atopic dermatitis family history effects 119–122
    breastfeeding comparison studies 111, 112
    cow’s milk formula comparison studies 112–114
    meta-analysis 111
    recommendations 114–116
    study design 122
    tolerance induction 120, 121
  omega-3 fatty acid supplementation protection
    infants and atopy 212
    pregnancy 206
  probiotic prevention studies 87
  weaning timing in prevention, see Solid food introduction

Aluminum, formula content and toxicity 5

Appetite
  central control 33–36
  genes in regulation 32, 33

Asthma
  cancer relationship studies 148
  maternal disease and breastfeeding effects 101, 102, 106, 107
  obesity relationship 45
  staphylococcal colonization of vagina during pregnancy effects 86
Subject Index

Atherosclerosis, see Cardiovascular disease
Attention-deficit/hyperactivity disorder (ADHD), omega-3 fatty acid supplementation studies 216, 217

Birth weight
adult body mass index relationship 53–57, 64
breast cancer association studies
birth length studies 168, 172, 173
cohort studies 168–171
rationale for effect 167, 168
vitamin C, maternal intake effects 59

Breast cancer, see Cancer
Breastfeeding
allergy prevention
allergen content of breast milk 96
components of breast milk 94, 95
duration of breastfeeding 100, 101
hydrolyzed infant formula comparison studies 111, 112
infection role and breast milk modulation 95
maternal asthma effects 101, 102, 106, 107
maternal food allergen avoidance diets 103, 107
meta-analysis 96–99, 109
overview 93
prospective intervention studies
no-effect studies 102, 103, 105, 106
positive-effect studies 99, 100
study design 96
bone mass effects 138
breast cancer risks in later life 181–183
cardiovascular disease prevention 3, 4, 20–23, 28
diabetes protection studies 187, 188
eosinophilic diseases in infants 107
fatty acid composition of milk 240, 241
gut microbiota effects 86
hypertension prevention 21
maternal asthma effects 101, 102, 106, 107
milk protein identification 249
necrotizing enterocolitis prevention 2
obesity prevention in childhood 59, 62–64
omega-3 fatty acid supplementation of mothers 206
postnatal growth acceleration prevention 4
weaning, see Solid food introduction

Calcium, childhood diet and osteoporosis impact 139–141, 147, 149, 150
Cancer
asthma relationship studies 148
chemoprevention 156
diabetes type 2 and breast cancer association mechanisms 185–187
risks 185
early life nutrition studies
animal studies of breast cancer 165, 166
birth weight-breast cancer association
birth length studies 168, 172, 173
cohort studies 168–171
rationale 167, 168
breastfeeding versus formula-fed infants and later breast cancer 181–183
childhood cancer 164
dieting effects 192, 193
growth patterns and breast cancer risks 183–185
maternal age-breast cancer association rationale 173, 174
relative risk studies 175–177
preeclampsia-breast cancer association
maternal risks 178–180
protective effects in daughters 178–180
rationale 175, 177
preterm infant risks of breast cancer 173, 174
prospects for study 192, 193
epidemiology 153
initiation targets and nutritional modulation
carcinogen activation 156–159
carcinogen detoxification 157, 159
DNA repair 157, 158, 160
multistage carcinogenesis 154–156
pregnancy growth factors 166, 167
Subject Index

promotion/progression targets and nutritional modulation
epigenetic changes and cell signaling 160–162, 164
inflammation 162, 164, 165
p53 gene mutations 162, 163
reactive oxygen species scavenging 163, 164
Cannabinoids, obesity role 35
Cardiovascular disease
atherosclerosis in children 16, 17, 25, 26
breastfeeding, prevention 3, 4, 20–23, 28
epidemiology 15
fetal origins hypothesis 15
infant formula long-chain polynsaturated fatty acid supplementation and risk marker response 211, 212
mechanisms of childhood origins heredity 18
nutrition and cardiovascular risk factors 19, 20
thrifty genotype hypothesis 18
thrifty phenotype hypothesis 19
metabolic syndrome in children, obesity and cardiovascular risks 17, 18, 258
nutritional interventions childhood intervention trials 23, 24
obesity prevention 23 infancy 20–23
postnatal growth acceleration hypothesis 4, 22, 23
risk factors in childhood 15
Celiac disease, diabetes association 72, 73, 77–79
Cereals, diabetes risks 72, 73, 77–79, 189, 190
Cesarean section, allergy risks 91
Cholesterol, obesity relationship in children 28, 29
Cow’s milk allergy prevention studies with hydrolyzed infant formula versus cow’s milk formula 112–114
diabetes type 1 development role 71, 188, 189
Cyclooxygenase (COX), dietary modulation 164, 165
Cystic fibrosis, fracture risk 150, 151

Diabetes mellitus
breast cancer association with type 2 disease mechanisms 185–187 risks 185
childhood classification 67, 68 definition 67 historical perspective 67 seasonality 78, 79
type 1 disease breastfeeding studies 187 celiac disease association 72, 73, 77–79
course 68, 69 epidemiology 69
infant formula long-chain polynsaturated fatty acid supplementation response 212
nutritional risk factors 71 T helper cell function 78
treatment 73 vaccinations in etiology 71 viral etiology evidence 70, 71, 78–80
vitamin D role 73
type 2 disease breastfeeding studies 188
 genetics 73, 74
prevention 74, 75
programming 74
cow’s milk risks 188, 189
Diarrhea, probiotic protection studies 84, 85
Dual-energy X-ray absorptiometry (DXA), measurements in children 136, 137, 141, 146, 147
Epigallocatechin-3-gallate (EGCG), cancer chemoprevention 159, 160
Essential fatty acids, see Fatty acids
Ethics
health care delivery 255
’-omics’ research concerns 254, 255
Fatty acids
accretion of long-chain polynsaturated fatty acids in fetus and infants 205
adipogenesis
fatty acid composition during development 238, 239
Fatty acids (continued)
- fatty acids as adipogenic hormones 236–238
- breast milk composition 240, 241
- dietary omega-6:omega-3 fatty acid ratio 235
- fat composition in early life and obesity relationship 240, 241
- functions 203, 204
- intrauterine growth retardation abnormalities 229, 231
- metabolism 203, 204, 238, 239
- rat studies of essential fatty acid supplementation
dam supplementation in pregnancy/lactation and neonatal immune function 223, 224
- leptin production in suckling rat offspring 224, 225, 231, 265
- oral tolerance appearance in suckling rat offspring 225–228, 231, 233, 234, 265
- requirements and recommendations 210, 217–219
- sources 219
- supplementation studies
  - attention-deficit/hyperactivity disorder, omega-3 fatty acid supplementation studies 216, 217
- infant formula
  - atopy response 212
  - biochemical status 206, 207
  - cardiovascular risk marker response 211, 212
  - diabetes type 1 response 212
  - limitations of trials 209–212
  - preterm infants 207, 208
  - prospects for study 220, 221
  - safety 211, 218, 220, 221
  - term infants 208, 209
  - lactation 206
  - pregnancy 205, 206, 216
  - prospects for study 220, 221
  - study design 215
  - transcriptome analysis 249
- Infant formulas
- allergy prevention studies with hydrolyzed infant formula
- atopic dermatitis family history effects 119–122
- breastfeeding comparison studies
  - 111, 112
- cow's milk formula comparison studies 112–114
- meta-analysis 111
- recommendations 114–116
- study design 122
- tolerance induction 120, 121
- aluminum content and toxicity 5
- breast cancer risks in later life 181–183
- hydrolyzed formula types 110
- long-chain polyunsaturated fatty acid supplementation studies
- atopy response 212
- biochemical status 206, 207
- cardiovascular risk marker response 211, 212
- diabetes type 1 response 212
- limitations of trials 209–212
- preterm infants 207, 208
- prospects for study 220, 221
- safety 211, 218, 220, 221
- term infants 208, 209
- soy formula and peanut allergy risks 118
- Infection, endothelial function effects in children 26
Inflammation
dietary modulation 164, 165
gene expression studies 250
obesity association 43–46, 48
tumor promotion 162
Intelligence quotient (IQ), infant
nutrition effects 4, 5
Intrauterine growth retardation (IUGR)
immunological aberrations 229–231
polyunsaturated fatty acid
abnormalities 229, 231
risk factors 228, 231
Lactation, see Breastfeeding
Leptin
essential fatty acid supplementation
and production effects in suckling
rat offspring 224, 225, 231, 265
obesity role 34, 35
therapeutic targeting 27
Long-chain polyunsaturated fatty acids,
see Fatty acids
Maternal age, breast cancer association
studies
rationale 173, 174
relative risk studies 175–177
Metabolic syndrome, see also Diabetes
mellitus; Obesity, childhood
breast milk quality effects in mothers
